Yr & Section: BSIT 3-B

Part 1: System Idea & Recall

1. UML Diagrams

1. Use Case Diagram

Shows how users (actors) interact with the system and what actions they can perform.

2. Activity Diagram

Illustrates the step-by-step workflow or process inside the system.

3. Class Diagram

Displays the structure of the system by showing classes, attributes, and relationships.

4. Sequence Diagram

Shows how objects interact in a sequence over time.

2. System Idea

System Title: Lost & Found Item Tracking System

Short Description:

This system helps students or users report, search, and claim lost items within a school or community. Users can upload details of lost or found items, including descriptions and images. The system matches lost and found reports to help return items to their owners. It improves organization and reduces the chances of losing belongings permanently.

Main Features:

- Report lost items
- Report found items
- Search and match items
- Claim item verification
- Notification for matched items

Part 2: UML Diagram Creation

1. Use Case Diagram

2. Activity Diagram

Part 3: SDLC Application

1. Planning:

Identify the problem of lost items and plan a system to help users report and recover them efficiently.

2. Design:

Create UML diagrams and design how users interact with the system and how data is stored.

3. Implementation:

Develop the system using a programming language and database to handle item records.

4. Testing:

Test the system to ensure users can report, search, and claim items without errors.

Part 4: Reflection

1. What did you learn from creating UML diagrams?

I learned how UML diagrams help visualize a system clearly, making it easier to understand processes and interactions.

2. Why is planning (SDLC) important before building a system?

Planning ensures the system is organized, reduces errors, and helps developers build the system more efficiently.
